Haptic feedback to provide spatial information to the user

**Haptic feedback**

Haptic - Uses sense of touch

**Spatial Information**

- Location
- Orientation
- Distance

**Touch** – Last sense to fade off when we grow old

- Haptics used when it's inappropriate to use other feedback.
- Changes the way people interact with the 'Real World' through devices
- Example: Mobility-assistance applications for visually impaired.
- Combines Geography, Engineering, Computer Science, and Psychology.
- Young vibrant research field – with huge potential for contributions
